

4th Grade Science Units -

High Priority

Parts identified as high priority are seen as important to teach. These units either strongly tie into the science standards at this particular grade level or build crucial vocabulary or understanding. These lessons should be taught.

Medium Priority

Parts identified as medium priority are important to teach, but parts could be modified if time is an issue. These parts of the investigation might have important pieces that connect with other parts or reading that helps to build understanding.

Low Priority

Parts identified as low priority are able to be skipped, while students won't be missing out on important standards or content. If time permits, these are the "fun" activities and build on the content being taught, but aren't crucial.

Soils, Rocks and Landforms

In this unit, there are a lot of activities that are important for basic exposure to science for 4th graders. Students spend a significant amount of the kit identifying soils in their environment and experimenting with the interaction with water.

In this kit, there are many Science and Engineering Processes (SEP's) that students explore that are important to the development of students as scientists. (*Asking Questions, Planning and Carrying out Investigations, Analyzing and Interpreting Data, Constructing Explanations, Engaging in Argument from Evidence, and Obtaining, Evaluating, and Communicating Information*) Students also use the *Crosscutting Concepts such as Patterns, Cause and Effect, Systems and System Models, Stability and Change and Scale, Proportion and Quantity.*

*** If time is limited, the entire Investigation 4 could be skipped as all standards are strongly met in other Investigations in the kit.*

Energy

In this unit, there are a lot of activities that are important for the basic exposure to science for 4th graders. Students explore the concepts of waves and wavelengths as well as energy and transfer of energy.

In this kit, there are many Science and Engineering Processes (SEP's) that students explore that are important to the development of students as scientists. (*Planning and Carrying out Investigations, Analyzing and Interpreting Data, Asking Questions, Constructing Explanations*) Students also use the *Crosscutting Concepts such as Systems and System Models, Energy and Matter, Patterns, Stability and Change and Cause and Effect* as their scientific lense.
