

Key

Chapter 14 Review

1. Why do we use an equation for a chemical reaction that correctly preserves the number and type of atoms on both sides of the reaction?

To comply with the Law of Conservation of mass -
mass is neither created or destroyed in a chemical reaction.

2. What is the number in an equation that designates the number of molecules of a substance taking part in a chemical reaction called?

Coefficient $\underline{\underline{2}} \text{ H}_2 + \text{O}_2 \rightarrow \underline{\underline{2}} \text{ H}_2\text{O}$

3. What is the substance formed in a chemical reaction called?

Product(s)

4. What are the starting substances in a chemical reaction called?

reactant(s)

5. What is the solid product that comes out of solution in a chemical reaction called?

precipitate

6. Define the following terms:

- a. (aq), (s), (l), (g)

aqueous (in solution), solid, liquid, gas

- b. activation energy

Energy required for a reaction to occur

- c. coefficient (in a chemical equation)

in front of a substance in a chemical equation that represents the # of particles of the substance.

- d. subscript (in a chemical formula)

lower # after an element which designates how many of that atom.

- e. precipitate

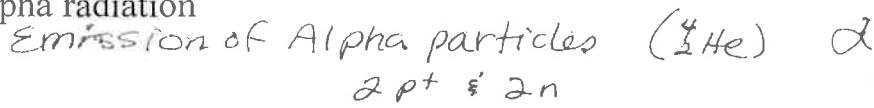

Solid substance that comes out of solution

- f. endothermic/exothermic

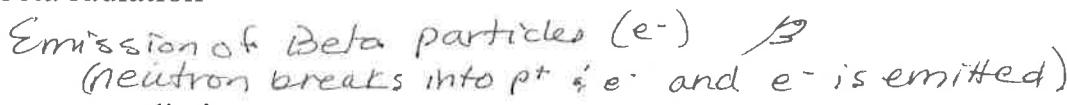

Endo: energy absorbed

exo: energy released

g. alpha radiation

h. beta radiation

i. gamma radiation

High energy electromagnetic radiation γ

j. half-life

Amount of time required for $1/2$ of a radio isotope to decay

k. fusion/fission

Fusion: combining of nuclei

Fission → splitting of nuclei

7. How many kilo, deci, centi, and milli grams are in 1 gram?

$$1\text{ Kg} = 1000\text{ g}$$

$$1000\text{ mg} = 1\text{ g}$$

$$10\text{ dg} = 1\text{ g}$$

$$100\text{ cg} = 1\text{ g}$$

8. Write the balanced equation for the following reaction: The fuel used in gas grills is called propane (C_3H_8). Propane reacts with oxygen gas (O_2) found in the air to produce carbon dioxide (CO_2) and water vapor (H_2O).

9. Is the following reaction endothermic or exothermic?

Endothermic

10. Name three examples of radiation that you might encounter in your environment?

Cell phones, air travel, x-rays, basements, space
brick/stone buildings, bananas, Brazil nuts

11. What radioactive technique is used to determine the age of fossils?

Carbon-Dating

12. Carbon-14 undergoes beta decay to become another element.

a. What is the product of the radioactive decay?

b. What is the new element?

Nitrogen-14

13. Complete the table below for the indicated radioactive decay reactions.

Type of decay	Proton change	Neutron change	Atomic # change	Mass # change
Alpha decay	-2	-2	-2	-4
Beta decay	+1	-1	+1	∅
Gamma decay	∅	∅	∅	∅

14. What does the Law of Conservation of Mass state?

Mass cannot be created or destroyed in a chemical reaction or physical change.

15. In the chemical equation below:

a. What are the reactants?

b. What are the products?

c. What does the arrow mean?

"to form" or "yields"

16. Describe the five types of reactions.

- Synthesis: $A + B \rightarrow AB$ Two or more substances combine to form one product
- Decomposition: $AB \rightarrow A + B$ One compound breaks down into 2 or more substances
- Single Displacement: $A + BX \rightarrow AX + B$
An element replaces a similar element in a compound.
- Double Displacement: $AB + CD \rightarrow AD + CB$
Ions exchange places. Produces either a precipitate, a gas, or water.
- Combustion: Substances combines with Oxygen to produce energy synthesis with O_2 or Carbon compound + $O_2 \rightarrow CO_2 + H_2O$

17. Balance the following equations and indicate what type of reaction it is.

Synthesis

Synthesis

single

single

combustion
