Study Guestians

A survey was conducted of television viewership. A group of 300 viewers were asked which type of TV show they prefer. The results were organized into the table below.

	Drama	Comedy	Reality	Sports
Aged 30 years and Younger	65	128	57	50
Older than 30 Years Old	75	110	43	72

A χ^2 test was carried out, at the 5% significance level. The χ^2 critical value of the test is 7.82.

(a) Write down the null hypothesis for this test.

[1]

[1]

- (b) Write down the number of viewers who preferred sports and were older than 30 years old.
- (c) Use your graphic display calculator to find the χ^2 statistic for this test. [2]
- (d) Determine, giving a reason, whether the null hypothesis should be accepted. [2]

A real estate developer conducted a survey. He asked 100 people who live in the city and 100 people who live in the suburbs if they prefer bicycling, driving, walking, or taking public transportation to work. The results are shown in the table below.

	City	Suburbs
Bicycle	15	20
Drive	35	30
Walk	15	20
Public Transportation	35	30

A χ^2 test was conducted at the 5% significance level.

(a) Write down the null hypothesis for this test.	[1]
(b) Write down the number of degrees of freedom.	[1]
(c) Use your calculator to find the <i>p</i> -value for this test.	[2]

The surveyor claims that whether people live in the city or suburbs is independent of their choice of getting to work.

(d) Determine whether this claim is justified. Give a reason for your answer. [2]

LSRL

A data collection consisting of 30 primary years students shows their body weight (W) in kilograms versus the distance (D) in meters they can run in 60 seconds.

The correlation coefficient between variables W and D is -0.928. The following is also known:

 $\overline{W} = 48 \ kg$ and $\overline{D} = 120 \ m$

And the regression equation for the line of best fit between E and V is given by

D = kW + 192 where k is a real number constant.

Name

a. Find k.

(b)

b. Use your result from part (a) above to predict the distance D run by a student with a weight W of 45 kg.

Ø

The table below shows the results of a fitness test given to six middle years students. Each student has corresponding scores for cardiovascular recovery time (T) in seconds after a six minute run along with the distance D in centimetres recorded for a standing jump.

Student	А	В	С	D	Ε	F
Recovery Time (T) - sec	300	420	500	270	600	480
Jump Distance (D) - cm	190	175	160	200	140	170

Find the equation of the line of best fit (LSRL) using the formula. Write formulas and critical totals.
