Pick up the Warm Up

You'll need your Pink Chi-Square packet from yesterday as a reference

do #1 and #2 only
for now

Warm Up

Practicing Using the Chi-Square Test of Independence

Use your notes as needed. $(5-1)$ $(2-1)$ male
female

	red	green	blue	black	silver
male					
female					

1. A researcher consulted 500 men and women to see if the colour of the car they drove was independent of gender. The colours were red, green, blue, black, and silver. A χ^2 test was conducted at the 5% significance level and the value found was 8.73.

a. Write down the null hypothesis

 H_0 :

Color is independent of gender ✓

b. Find the number of degrees of freedom. $(2-1)(5-1) = 4$

c. Write down the critical value for this test.

9.488 ←

d. Is car colour independent of gender? Give a clear reason for your answer.

Yes

$$\chi^2 \text{ of } 8.73 < 9.488$$

2. Suppose a similar test was conducted on a different population of 300 people. A 5% significance level is used. It was found that the p-value was 0.04. Is colour independent of gender?

$$p = .04$$

4%

Since the p-value < 0.05 , we must reject H_0 . Thus gender and car color preference are associated.

Aim
for today

The limitations of the χ^2 Test of Independence

- A. Not enough data ✓
- B. 2×2 adjustment

3.

Consider the contingency table alongside:

- a Construct the expected frequency table. ✓
- b Are any of the expected frequencies less than 5?
- c Combine the data so that none of the cells have an expected frequency less than 5.

		Own a pet?	
		Yes	No
Age	0 - 19	5	3
	20 - 29	2	22
	30 - 49	42	58
	50+	39	34

a)

	Yes	No
0-19	4	3
20-29		
30-49		
50+		

Age	0-29	37	25
	30-49	42	58
	50+	39	34

In a **2 by 2** contingency table:

-- Yate's continuity correction must be used when calculating χ^2

If $df = 1$, we use

$$\chi_{calc}^2 = \sum \frac{(|f_o - f_e| - 0.5)^2}{f_e}$$

where $|f_o - f_e|$ is the **absolute value** or **modulus** of $f_o - f_e$

The following table shows the results from a random sample carried out so that the question about the relationship between education and job satisfaction could be analysed.

		Completed University		
		YES	NO	
Satisfied in job	YES	272	618	890
	NO	238	292	530
		510	910	1420

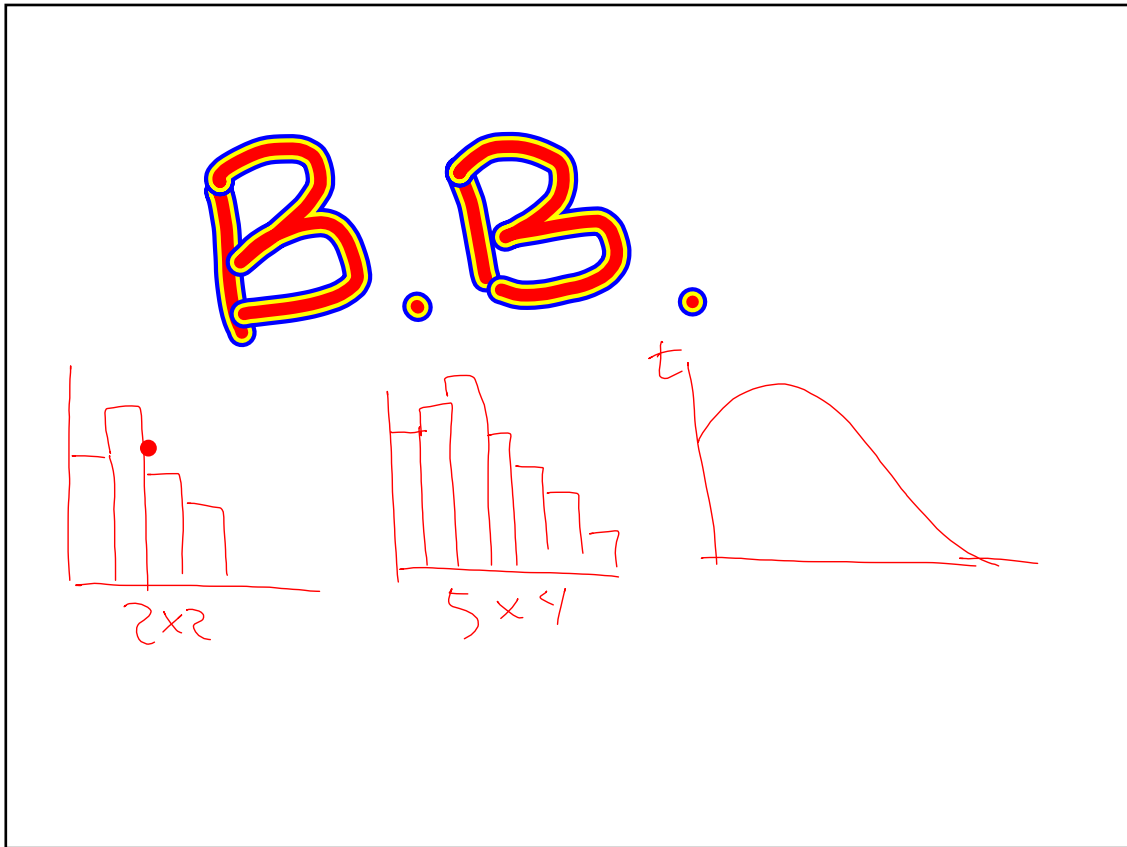

1. Calculate the expected freq
2. Set up a table to organize.

f_o	f_e	$ f_o - f_e - 0.5$	$\frac{(f_o - f_e - 0.5)^2}{f_e}$
272	319.65		
618	570.35		
238	190.35		
292	339.65		

$\chi^2_{calc} = \sum \frac{(|f_o - f_e| - 0.5)^2}{f_e}$

$\chi^2 = 29.1$

$$\chi^2_{calc} = \sum \frac{(|f_o - f_e| - 0.5)^2}{f_e}$$

Brainstorm:

Think back to all of the statistical graphs, statistics, measurements so far in this course:

Correlation btwn amount spent vs length of stay

Relationship btwn occupation and amt spent
 " " genders and occupation

What gender would spend more. • $\frac{\bar{x}}{y}$

H-H
 H-H

m

f

Coffee Shop Brainstorm

In your group :

Now that you have some statistical tools, What type of questions could be investigated and answered?

Ideas

Ideas

relationship between age & time spent
 relation between age/spent

HISTOGRAM / occupation
 and \$

Relation between \$ spent vs time
 Stem/leaf - Extent of see

Avg of Age in Coffee

relationship btwn occupation
vs length of stay

Project Scoring Guide

- a student friendly version

-the actual one is posted on the class blog if /
when you want to look at it.

Definitely get a folder to house all project materials and keep separate from the regular course materials.

LCQ on Correlation

You can use

Assignment

Ch.11 Packet

p.341....#2 (use the χ^2 statistic)

p.344.... #1abcd

p.348.....#4 (use probability)

clearly show all
steps

3. The veterinarian has gathered the following data about the weight of dogs and the weight of their puppies.

		Dog		Total
		Heavy	Light	
Puppy	Heavy	36	27	63
	Light	22	35	57
Total		58	62	120

The veterinarian wishes to test the following hypotheses.

H_0 : A puppy's weight is independent of its parent's weight.

H_1 : A puppy's weight is related to the weight of its parent.

(a) The table below sets out the elements required to calculate the χ^2 value for this data.

(a) The table below sets out the elements required to calculate the χ^2 value for this data.

	f_o	f_e	$f_e - f_o$	$(f_e - f_o)^2$	$(f_e - f_o)^2 / f_e$
heavy/heavy	36	30.45	-5.55	30.8025	1.012
heavy/light	27	32.55	5.55	30.8025	0.946
light/heavy	22	27.55	5.55	30.8025	1.118
light/light	35	a	b	c	d

(i) Write down the values of a , b , c , and d .

$a = 29.45$ $b = -5.55$ $c = 30.8025$ $d = 1.046$ (4)

(ii) What is the value of χ^2_{calc} for this data?

$\chi^2 = 4.12$ by adding up values in last column (1)

(iii) How many degrees of freedom exist for the contingency table?

$df = (2-1)(2-1) = 1$ (1)

(iv) Write down the critical value of χ^2 for the 5% significance level.

3.841 (1)

(b) Should H_0 be accepted? Explain why.

Since $4.12 > 3.841$ we reject H_0 (2)

(Total 9 marks)

4) Let $x = 7.94$.

(a) Calculate the value of $\frac{2x+1}{x^3}$.

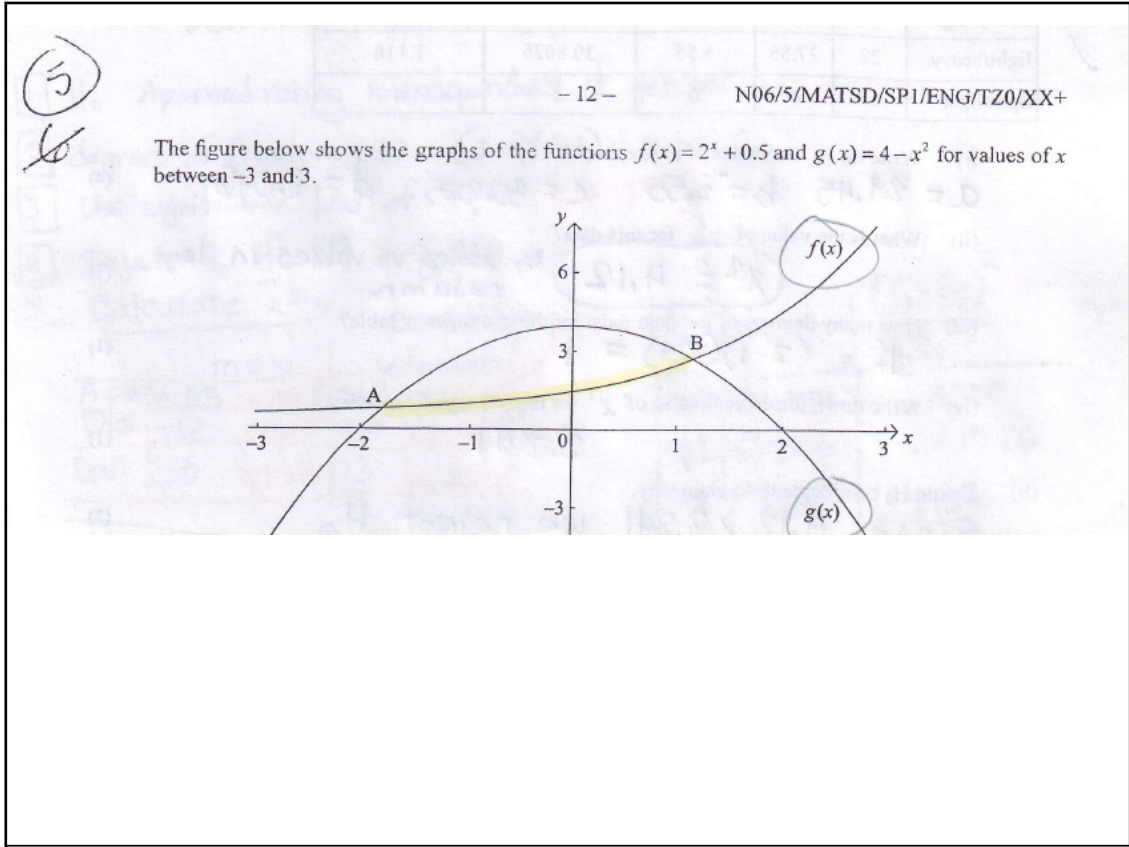

(b) (i) Give your answer correct to three decimal places. 0.03372... 0.034

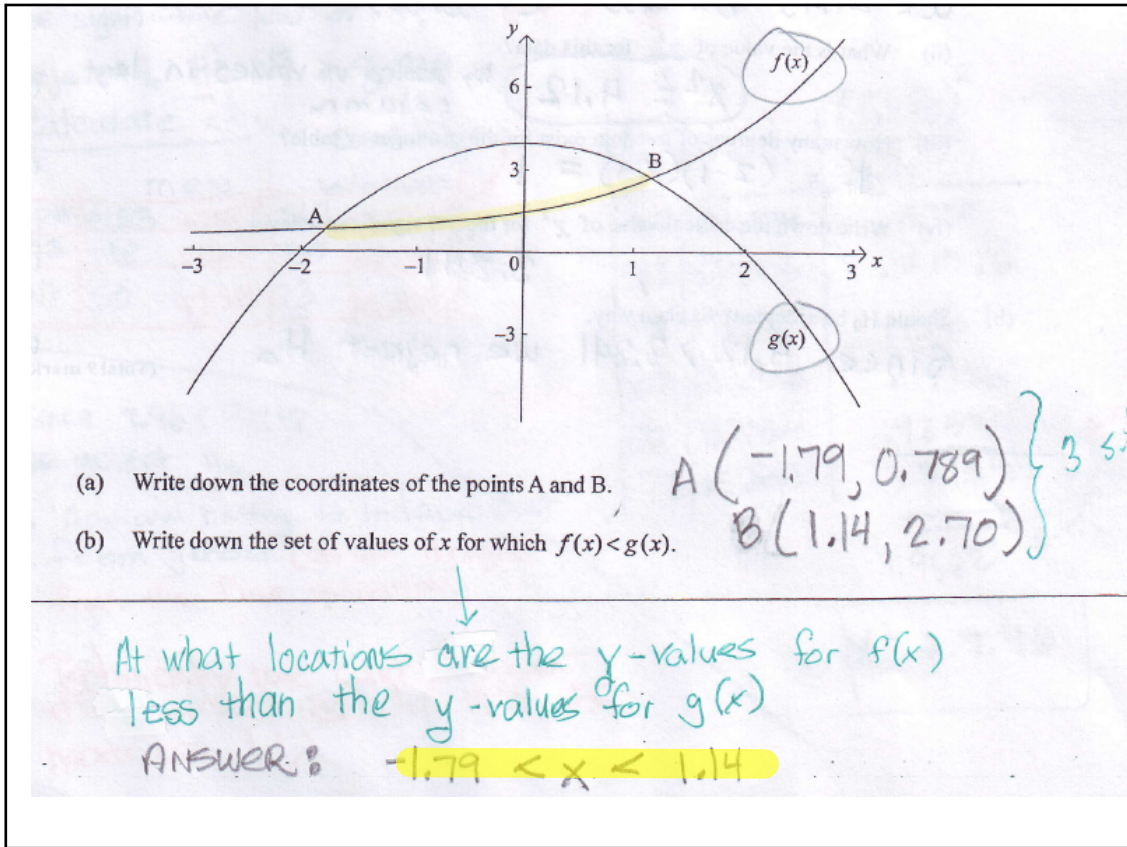

(ii) Write your answer to (b)(i) as a percentage. 3.4%

(c) Give your answer to part (b)(i) in the form $a \times 10^k$, where $1 \leq a < 10$, $k \in \mathbb{Z}$.

3.4×10^{-2}

↳ this means scientific notation a.k.a "STANDARD FORM"

A small Pennsylvania town.

The rest of the day today we will devote to learning what is involved in the course project.

- *Get an overview (only)*
- *Hear about some past projects*
- *Start brainstorming for yourself.*
