Researchers were studying how playing a dancing video game impacts heart rate. They measured the heart rates (in beats per minute) of 15 subjects before they danced a song and again after they finished dancing the song. They want to use these results to estimate the average difference between before and after heart rates.

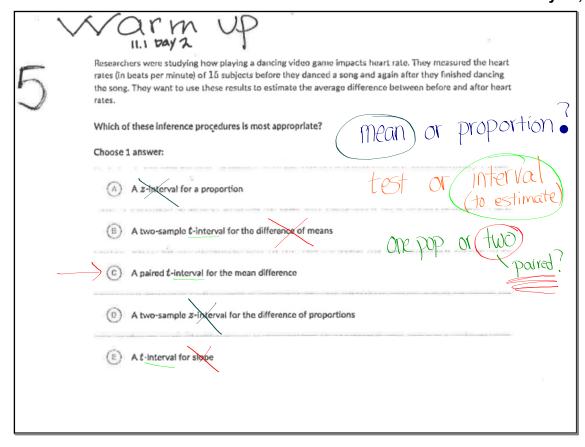

Which of these inference procedures is most appropriate?

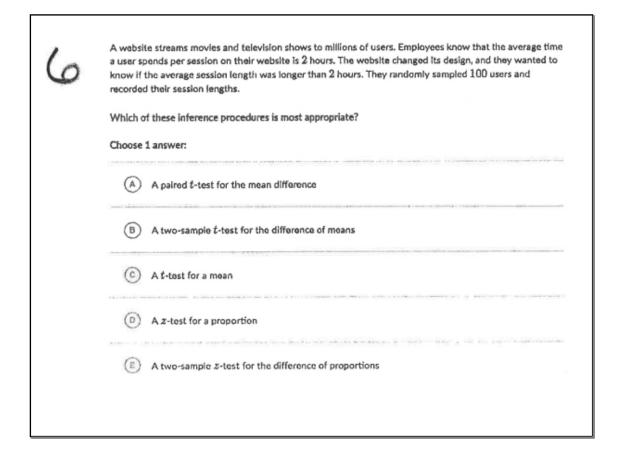

Choose 1 answer:

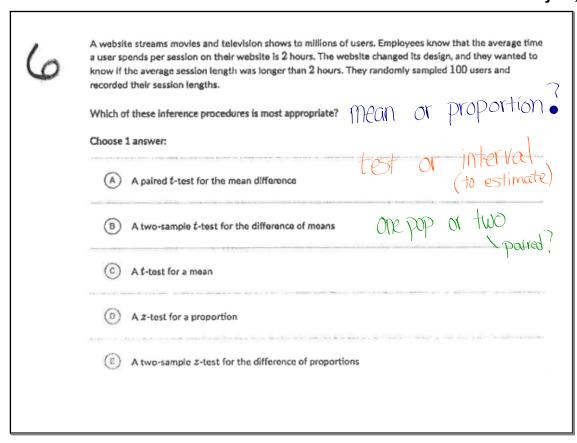

- (A) A z-interval for a proportion
- (B) A two-sample £-interval for the difference of means
- (C) A paired t-interval for the mean difference
- A two-sample z-interval for the difference of proportions
- (E) A t-Interval for slope

rates (rchers were studying how playing a dancing video game impacts heart rate. They measured the heart in beats per minute) of 15 subjects before they danced a song and again after they finished dancing ang. They want to use these results to estimate the average difference between before and after heart
	of these inference procedures is most appropriate? e 1 answer: Proportion
(A)	Az Interval for a proportion test or interval (to estimate)
(B	
C	A paired t-interval for the mean difference
0	A two-sample z-interval for the difference of proportions
Œ	A t-Interval for slope

Malcolm Gladwell
"Outlers"

Tries to explain Strange things

- ~ Pennsylvania town (unusually healthy)
 - ~ Eastern European Nattonal Soccer Team with unusual birthologs
 - ~ Similar In Canada

Prek Up Handout

- let's road about

an observation in Canada

In his book Outliers, Malcolm Gladwell suggests that a hockey player's birth month has a big influence on his chance to make it to the highest levels of the game. Specifically, because January 1 is the cut-off date for youth leagues in Canada [where many National Hockey League (NHL) players come from], players born in January will be competing against players up to 12 months younger. The older players tend to be bigger, stronger, and more coordinated and hence get more playing time, more coaching, and have a better chance of being successful. To see if birth date is related to success (judged by whether a player makes it into the NHL), a random sample of 80 NHL players from a recent season was selected and their birthdays were recorded. The one-way table summarizes the data on birthdays for these 80 players.

BirthdayJan-MarApr-JunJul-SepOct-DecNumber of players32201612

Do these data provide convincing evidence that the birthdays of NHL players are not uniformly distributed across the four quarters of the year? If there is statistically significant evidence, perform a follow up analysis.

the year? If there is statistically significant evidence, perform a follow up analysis.

Use d=0.05

State Hypothesies:

Ho: The birthdays of all NHL players are uniformly distributed across the four quarters of the year.

Ha: The birthdays of all NHL players are not uniformly distributed a cross the four quarters of the year.

N= 80

Birthday	Jan-Mar	Apr–Jun	Jul-Sep	Oct-Dec
Number of players	32	20	16	12
	20	20	20	20.

$$80(\frac{4}{7}) = 50$$

```
Plan Name of Procedure: (hi - Square test for Goodness of fit & conditions:

Random - data came from a random sample of NHL Players,

10' - Assuming that 80 < to(ef all NHL Players)

Large Counts - All expected Counts = 90(t) = 20 ? 5
```

```
Plan Name of Procedure: (hi-square test for Goodness of fit conditions:

Random - data came from a random sample of NHL Players.

10.1. - Assuming that 80 4 to (of all NHL Players)

Large Counts - All expected Counts = 80(4) = 20 > 5

So we can generalize to

All Players
```

Large Counts condition

- ensures that the probability distribution Ne use (chi-Square distrib. In this case) to Calculate P-Value is a good model.

Do

Specific Formula
$$\chi^2 = \sum \frac{(0-E)^2}{E}$$

Picture:

Work Test Star
$$\chi^{2} = \frac{(32-20)^{2}}{20} + \frac{(20-20)^{2}}{20} + \frac{P-\text{Value}}{20}$$

Test Statistic

$$= 72 + 0 + 8 + 32 =$$

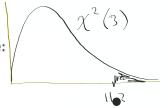

$$df = \text{Categories} - 1 = 4 - 1 = 3$$

Specific Formula
$$\chi^2 = \sum \frac{(0-E)^2}{E}$$

Work

$$\chi^{2} = \frac{(32-20)^{2}}{20} + \frac{(20-20)^{2}}{20} + \cdots$$

Picture:

Test Statistic
$$\chi^2 = 11.2$$

P-Value

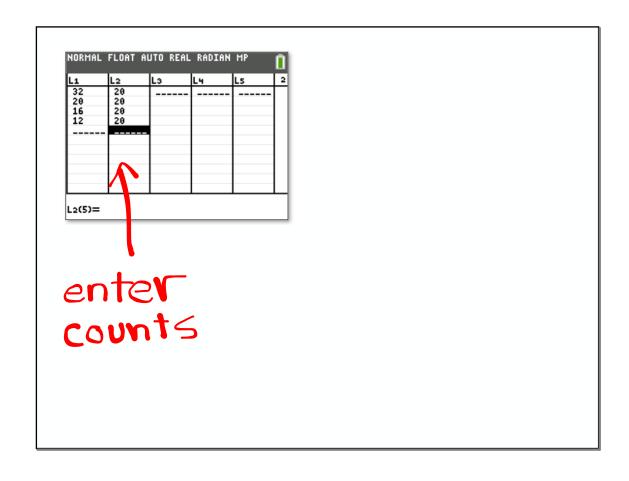

Conclude

Conclude

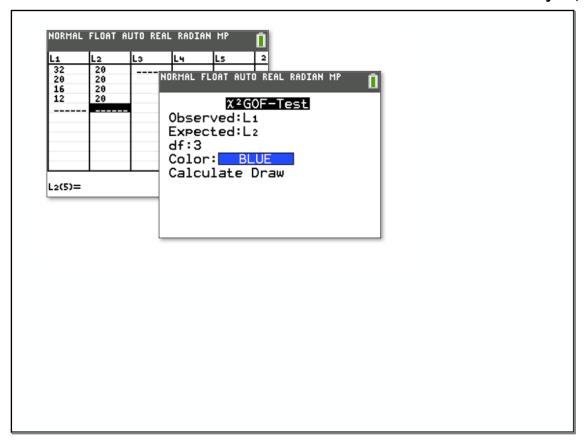

Because the P-Value of 0.011 < 0 = 0.05, we reject to. .. We have convincing evidence that the birthdays of NHL players are not uniformly distributed across the four quarters of the year.

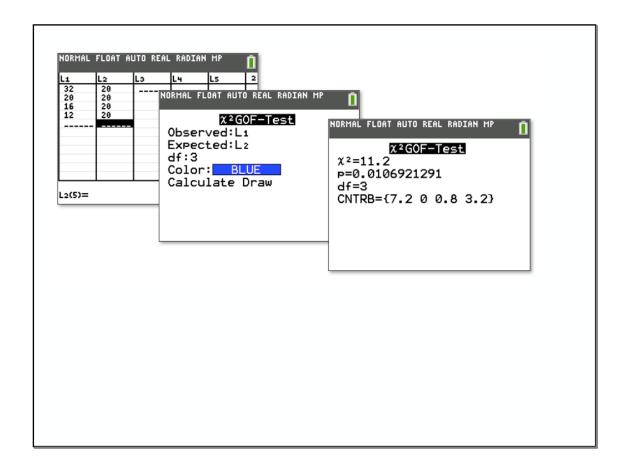

Never "accept Ho"

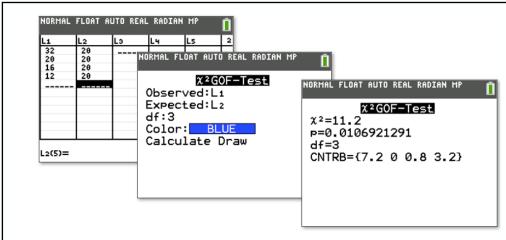

In a trial A verdict of "NOT GUILTY" doesn't mean the defendant is necessarily innocent.

February 18, 2020

Note: When you run the chi-square test for goodness of fit on the TI-84 calculator, a list of these individual components will be produced and stored in a list called CNTRB (for contribution).

Follow Up Analysis

If the sample data lead to a statistically significant result, we can conclude that our variable has a distribution different from the one stated.

If the sample data lead to a statistically significant result, we can conclude that our variable has a distribution different from the one stated.

To investigate *how* the distribution is different, start by identifying the categories that contribute the most to the chi-square statistic.

If the sample data lead to a statistically significant result, we can conclude that our variable has a distribution different from the one stated.

To investigate *how* the distribution is different, start by identifying the categories that contribute the most to the chi-square statistic.

Birthday	Observed	Expected	0 – E	$(0 - E)^2/E$
Jan-Mar	32	20	12	7.2
Apr–Jun	20	20	0	0.0
Jul-Sep	16	20	-4	0.8
Oct-Dec	12	20	-8	3.2

The two biggest contributions to the chi-square statistic came from Jan–Mar and Oct–Dec.

Birthday	Observed	Expected	0 – E	$(0 - E)^2/E$
Jan-Mar	32	20	12	7.2
Apr–Jun	20	20	0	0.0
Jul-Sep	16	20	-4	0.8
Oct-Dec	12	20	-8	3.2

The two biggest contributions to the chi-square statistic came from Jan–Mar and Oct–Dec.

Birthday	Observed	Expected	0 – E	$(0 - E)^2/E$
Jan-Mar	32	20	12	7.2
Apr–Jun	20	20	0	0.0
Jul-Sep	16	20	-4	0.8
Oct-Dec	12	20	-8	3.2

In October through December, 8 *fewer* players were born than expected.

AP® Exam Tip

You can use your calculator to carry out the mechanics of a significance test on the AP® Statistics exam.

But there's a risk involved. If you just give the calculator answer with no work, and one or more of your values is incorrect, you will likely get no credit for the "Do" step.

We recommend writing out the first few terms of the chi-square calculation followed by ". . .". This approach might help you earn partial credit if you enter a number incorrectly.

Be sure to name the procedure (chi-square test for goodness of fit) and to report the test statistic (χ^2 = 11.2), degrees of freedom (df = 3), and *P*-value (0.011).

Car Colors in Arizona Car Colors in Arizona - Does the warm, sunny weather in Arizona affect a driver's choice of car color? Cass thinks that Arizona drivers might opt for a lighter color with the hope that it will reflect some of the heat from the sun. To see if the distribution of car colors in Oro Valley, near Tucson, is different from the distribution of car colors across North America, she selected a random sample of 300 cars in Oro Valley. The table shows the distribution of car color for Cass's sample in Oro Valley and the distribution of car color in North America, according to www.ppg.com.

Color	White	Black	Gray	Silver	Red	Blue	Green	Other	Total
Oro Valley sample	84	38	31	46	27	29	6	39	300
North America	23%	18%	16%	15%	10%	9%	2%	7%	100%

1. Do these data provide convincing evidence that the distribution of car color in Oro Valley differs from the North American distribution?

Ho: The distrib of car colors in Oro Valley is the same as the distrib of car colors across North America.

Ha: the distrib. of car colors in oro Valley is not the same as the distribution of cor colors across North America.

Use $\alpha = 0.05$

```
STATE Chi - Square test for goodness of fit

Aandom - Random sample of 300 cars

10'' - 11=800 < 15(all cars in ore Valley)

Large Counts - Expected Counts (69,54,48,45,30,27,6,21) > 5

PLAN:
```

```
STATE: Chi - Square trest for goodness of fit

Aandom - Random sample of 300 cars

10'' - 11= 300 < 12(all cars in ore Valley)

Large Counts - Expected Counts (69,54,48,45,30,27,6,21) > 5

PLAN:
```

Chi - Square test for goodness of fit

Random - Random sample of 300 cars

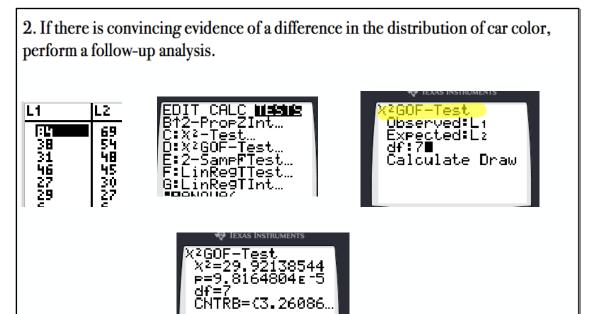

10" - 11=300 < 10 (all cars in ore Valley)

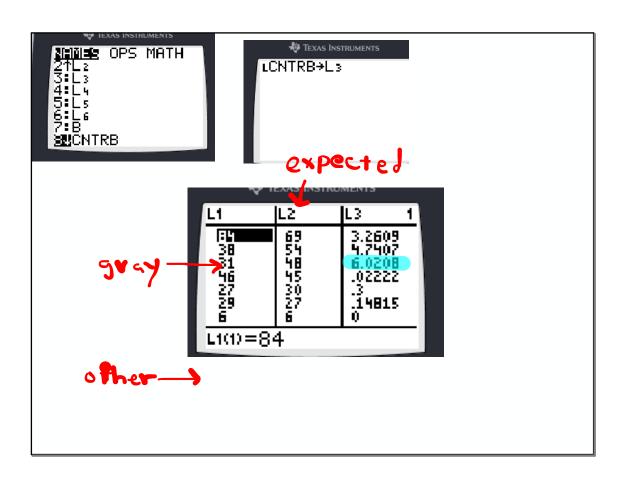

Large Counts - Expected Counts (69,54,48,45,30,27,6,21) > 5

$$\chi^2 = \frac{(84 - 69)^2}{69} + \frac{68 - 54)^2}{54} + \dots = 29.921$$
 df = 8-1 = 7
P-Value $\chi^2_{odf} \left[29.921, 10000, 7 \right] \approx 0$

Do: $\chi^2 = \frac{(94-69)^2}{69} + \frac{68-54)^2}{54} + \dots = 29.921$ df = 8-1=7 P-value $\chi^2_{edf} \left[29.921, 10000, 7 \right] \approx 0$

CONCLUDE: Because the -P-value of approximately 0 < d=0.05, we reject the we have convincing evidence that the distrib. of car colors in one valley is not the same as it is across North America.

2. If there is convincing evidence of a difference in the distribution of car color, perform a follow-up analysis.

The two biggest contributions to the statistic came from gray and other colored cars, there were fewer grays than expected and more "other-colored" cars than expected.
