

Polar Bears, Endangered?

Dieing, deserted, dead. Polar Bears are a white bear that is a related to the brown and black bear. The Polar Bear gets its name from the environment that it lives in. The Arctic, the coldest desert in the world. Polar bears used to live in peace and thrive in their climate but that has changed. Recent events in weather has made it clear that there is a victim to the melting icebergs. Climate change. Climate change has raised temperatures all around the world which is causing the Arctic to melt, and the polar bears to lose their homes. We need to help them or they will all go extinct. Why save the polar bears? What do they do in their life? Why are they going endangered? Is it necessary to save them? These are all questions that could help answer my question, are polar bears going to be endangered.

What do polar bears do in a lifetime? Polar bears are like regular brown and black bears who love to eat food. Mainly fish, seals, small whales, and walruses. Also like regular bears Polar bears protect their family, smell, eat, and sleep. Polar bears on the other love to swim in the ocean, and they swim all around. That is also how they get their prey.

Polar bears are going endangered because of global warming, which is melting the icebergs. Since climate change has been caused by humans so it's our fault that polar bears population has been cut in half across the arctic. Our greenhouse gasses and fossil fuels have released carbon dioxide into the air, polluting the ozone which is causing the temperatures to rise around the world. The rising temperatures are not only affecting the icebergs, but the ocean temperatures. This causes the fish to go deeper into the ocean

which can affect the polar bears, which in toll affects the entire ecosystem. If the fish are going deeper than the seals can't eat as much fish, so the polar bears can't eat as many seals which is another reason why climate change is affecting the polar bears.

But the real question is it necessary to save the polar bears? Yes, Polar bears are animals, all animals should be saved even the ones that most people don't think about. Climate change has affected polar bears greatly and just to donate time or money can help save the polar bears. If polar bears went extinct that would completely change the food change there would be to much fish, which means there will be a overpopulation of seals because that is what polar bears eat. From that overpopulation of seals that will bring less and less fish which can affect the people in Alaska, because fish is a main source of food for the people in Alaska also seals. That is why we need to save, or at least donate to save, the polar bears.
